Achieving Zero Intoxication Incidents

PROPOSED SOLUTION

Implement Ignition Interlock Devices (IID) across all fleet vehicles used by MoveInSync ONE, making it technically impossible for an intoxicated driver to start the vehicle.

WHY IID? (Core Rationale)

- Shifts control from manual checks → system-enforced prevention
- Eliminates dependency on human compliance
- Works every trip, every shift, every city

ASSUMPTIONS

- Vehicles are either owned or long-term vendor-managed
- Drivers cannot bypass vehicle ignition systems
- On-ground MoveInSync staff already manage fleet operations
- Zero tolerance is contractually enforceable

GOAL:

Zero incidents of drunk drivers reporting to duty AND operating vehicles

People, Process & Product Changes

PEOPLE CHANGES

- Mandatory driver onboarding on IID usage
- Clear communication: "Vehicle won't start if alcohol is detected"
- Incentives for sustained clean driving records
- Immediate suspension + review on IID violation attempt

PROCESS CHANGES

- Pre-trip process simplified: No ignition → no trip
- Shift assignment auto-cancelled if IID test fails
- Backup driver auto-triggered
- Incident logged centrally for Risk & Governance review

PRODUCT / TECH CHANGES

- IID installed in all fleet vehicles
- Device integrated with MoveInSync platform
- Logs: Breath test result, Timestamp, Vehicle ID, Driver ID

Key Advantage:
Prevention happens before the vehicle moves, not after a violation.

Assumption:
MoveInSync has operational authority over fleet onboarding, driver assignment, and platform workflows to enforce IID-based controls.

Proposal & Implementation Plan

PHASE 1: PILOT DEPLOYMENT – HIGH-RISK CONTROL

Objective: Validate IID effectiveness in highest-risk scenarios before full scale

Scope: Night shifts • Long routes • Vendors with prior incidents • 1–2 metros (e.g., Bengaluru, Hyderabad)

Key Activities:

- Install IID on limited fleet
- Train drivers & MoveInSync staff (device use, failure response)
- Run parallel monitoring: IID data + manual reports

Measures: Failed attempts • Operational delays • Driver/vendor feedback

Outcome: Proof IID prevents risky trips with minimal disruption

PHASE 2: PLATFORM & WORKFLOW INTEGRATION

Objective: Automate enforcement, eliminate manual dependency

Key Activities:

- Integrate IID data into MoveInSync backend
- Update trip logic: Auto-lock trip on fail → Trigger backup driver
- Build central dashboard: Real-time compliance, city/vendor/driver views
- Set alerts: Repeated fails • Tampering

Outcome: Automated, auditable, real-time alcohol compliance

PHASE 3: POLICY, LEGAL & CONTRACT ALIGNMENT

Objective: Make IID mandatory & enforceable

Key Activities:

- Update vendor SLAs: Mandatory installation + non-compliance penalties
- Amend driver contracts: IID consent + violation consequences
- Define escalation: Warning/retraining → Suspension/blacklisting

Outcome: IID becomes governance mandate, not just tech

PHASE 4: FULL-SCALE ROLLOUT & GOVERNANCE

Objective: Scale across metros with sustainable ownership

Key Activities:

- Phased city rollout by risk priority
- Introduce vendor cost-sharing post-pilot
- Establish Central Risk & Governance team: Dashboard monitoring, audits, monthly reports
- Continuous improvement: Device/process/policy refinements

Outcome: Self-sustaining, near-zero manual oversight prevention model

Foreseeable Problems & Risks and Mitigation

PROBLEMS DURING IMPLEMENTATION

Problem	Why It Happens	Solution
Driver resistance	Fear of job loss	Clear communication on zero-tolerance + training + safety-linked incentives
Vendor pushback	Cost & downtime	Phased rollout with pilot proof + shared cost model post-pilot
Device tampering	Attempt to bypass	Tamper-proof IIDs with real-time alerts + strict violation penalties
Edge cases	False positives	Manual override via central command + backup driver allocation

KEY RISKS

- IID malfunction delaying trips
- Drivers attempting proxy breath samples
- Legal concerns around privacy
- Operational delays during peak hours

RISK MITIGATION STRATEGIES

- Random mid-shift breath tests by ground staff
- Tamper-proof IIDs with alerts
- Manual override only via central command
- Clear legal consent during onboarding
- Redundant backup drivers per shift

Risks are anticipated, controlled, and neutralized through system-led enforcement rather than manual intervention.

Success Metrics

LEADING INDICATORS

(Predictive: Signal risks early via compliance & efficiency)

% Vehicles with Active IID

Why: Ensures high coverage to block impaired starts; low % flags installation/tampering gaps.

Measured: (Active IIDs / Required vehicles) × 100.

Target: 95–100%; alert <90%.

- On-time installs
- Recent calibrations
- No-tampering %

% Trips Blocked (Failed IID Test)

Why: Shows alcohol exposure attempts; high % = poor adherence; declining = improving behavior.

Measured: (Failed lockouts / Total starts + retests) × 100.

Target: <5% (ideally <2%); flag drivers >10%.

- By BAC level
- Time of day
- Repeat fails

Avg. Time to Assign Backup Driver

Why: Measures response speed; delays raise costs, risks, & dissatisfaction.

Measured: Lockout alert → backup confirmation time.

Target: <30–60 min; reduce over time.

- % resolved on time
- Cost per backup

LAGGING INDICATORS

(Outcome-based: Confirm prevention success after events)

Intoxication-Related Incidents (Target: 0)

Why: Ultimate safety measure; zero = program working.

Measured: Confirmed alcohol-linked crashes/violations.

Target: 0; root-cause any occurrence.

- Rate per miles
- Severity
- Pre/post comparison

Client Safety Escalations

Why: Reflects perceived safety; high = trust erosion.

Measured: Logged safety/IID-related complaints.

Target: <1–2/quarter; downward trend.

- Resolution %
- Severity
- Causes

Legal/Insurance Claims

Why: Financial & reputational risk; reduction proves ROI.

Measured: Alcohol-related claims count/value.

Target: Zero; track $ & frequency.

- % denied via IID proof
- Avg. claim cost

BUSINESS IMPACT METRICS

(Link safety to profitability & relationships)

Client Retention Rate

Why: Strong safety builds loyalty; incidents drive churn.

Measured: (Retained / Starting clients) × 100.

Target: >90–95%; link to safety trends.

- Safety-related churn
- NPS

SLA Compliance Score

Why: Lockouts/delays hurt SLAs; high = resilience.

Measured: % targets met (e.g., on-time trips).

Target: >98%; penalize IID breaches.

- IID-caused breaches %

Reduction in Manual Supervision Cost

Why: Shows ROI via automation shift.

Measured: Pre- vs. post-IID costs (hours/tools).

Target: 20–50% savings; $/driver/month.

- Fewer investigations
- Audit efficiency
